

#### ABSTRACT OF THE DISCLOSURE

A printer for forming an image on a surface of a recording medium includes a preprocessing device for preprocessing the surface of the recording medium to form an image on the surface 5 of the recording medium; a post-processing device for post-processing the surface of the recording medium preprocessed by the preprocessing device; a recording medium feed path formed between the preprocessing means and the post-processing means; a first feed device arranged on an upstream side of the recording 10 medium feed path; and a second feed device arranged on a downstream side of the recording media feed path. The first feed device and the second feed device are made different in driving control from each other. For printing a plurality of recording media successively, no large-scale arrangements are provided for 15 printing processes to meet a required printing accuracy and to shorten a processing time.
